a map with a blue line representing the cold front pushing into a red area representing warm air

How to approach this

- 1 Identify the Fronts Locate the cold front usually a blue line with triangles pointing in the direction of movement and the warm air mass represented by warmer colors on an isotherm map
- 2 Understand the Dynamics Remember that cold air is denser and pushes under warmer air This lifting action forces the warm air to rise potentially leading to cloud formation and precipitation
- 3 Predict the Weather Based on the fronts movement and the interaction of the air masses you can predict the likely weather conditions such as thunderstorms heavy rain or a significant temperature drop

Another Example Calculating Relative Humidity

The manual might contain problems requiring you to calculate relative humidity given temperature and dew point

Howto

The formula for relative humidity is $RH = \frac{e}{E_s} \times 100$ where e is the actual vapor pressure and E_s is the saturation vapor pressure

You'll need to use a psychrometric chart or a table to find the saturation vapor pressure at the given temperature

Then you can calculate the actual vapor pressure using the dew point temperature

Lets say

- 3 Temperature 25C
- Dew Point 15C

Using a psychrometric chart or table you'll find the saturation vapor pressure E_s at 25C and the actual vapor pressure e at 15C

Plug these values into the formula to calculate the relative humidity

Visual

Include a simple diagram of a psychrometric chart highlighting how to find the relevant values
